

Network Monitoring

As of April 30, 2007

www.comp-hut-com

The Computer Hut offers real-time network monitoring to help ensure that your network performs at optimum levels by detecting minor issues before they become serious problems. Servers, routers, firewalls and other network devices are monitored, and we are alerted when error conditions are met. Network monitoring, coupled with pro-active system maintenance, is an invaluable tool. There are many benefits beyond simply monitoring the network. All network devices can be queried (depending on licensing level) to generate inventory reports as well as management reports summarizing disk usage, installed software, and much more.

Network Monitoring Services

- Device Availability Monitoring
- WMI Monitoring
- Web Site Monitoring
- Network Services TCP Monitoring
- Custom Log File Monitoring
- SNMP Monitoring
- Security Monitoring - Windows
- Windows Services Monitoring

Device, System and Application Monitoring and Alerting Templates

- Less than 10 devicescall
- 10-24 devicescall
- 25-99 devicescall
- Up to 254 devices in a single subnetcall

Call for price quotes on additional subnets.

Prices subject to change without notice.
Check with a Computer Hut representative for full details.

*Network monitoring requires a dedicated computer to host the Onsite Manager monitoring agents and must be provided by the customer.

Gold and Silver service contract levels include network monitoring as specified in contract. Depending on the amount of data transmitted between The Computer Hut and Client's network, there may be an impact on available Internet bandwidth. Additionally, The Computer Hut is not responsible for alerts lost in transmission or intercepted.
